The pharmaceutical compositions of the present invention preferably contain the above preferred and specific preferred compounds.

The compounds of formula I may be prepared by reacting a compound of the formula

II

with a compound of the formula  $R^4H$  wherein  $R^1$ ,  $R^2$ ,  $R^3$  and  $R^4$  are as defined above in connection with formula I, and X is halogen (e.g., fluoro, chloro or bromo).

The reaction may be performed with or without a solvent, preferably at elevated temperature, and for a time sufficient to substantially complete the reaction. The reaction is preferably carried out in the presence of an acid acceptor such as an inorganic or organic base, e.g., an alkali metal or alkaline earth metal carbonate or bicarbonate or a tertiary amine such as triethylamine, pyridine, picoline, or 1,5-diazabicyclo[5.4.0]undec-5-ene (DBU).

The solvents for this reaction are solvents which are non-reactive under the reaction conditions such as acetonitrile, tetrahydrofuran, ethanol, chloroform, dimethylsulfoxide (DMSO), dimethylformamide, pyridine, water, or mixtures thereof.

The reaction temperature usually ranges from about 20°C to about 150°C.

Starting materials of formula II are known in the art, e.g., as disclosed in European Patent Application 86307045.4 (Publication No. 0215650).

The starting materials of formula  $R^4H$  have the following formulae

III

IV

wherein n and  $R^5$  are as defined above. The compounds of formulae III and IV are novel compounds. The following reaction schemes illustrate the preparation of these compounds.

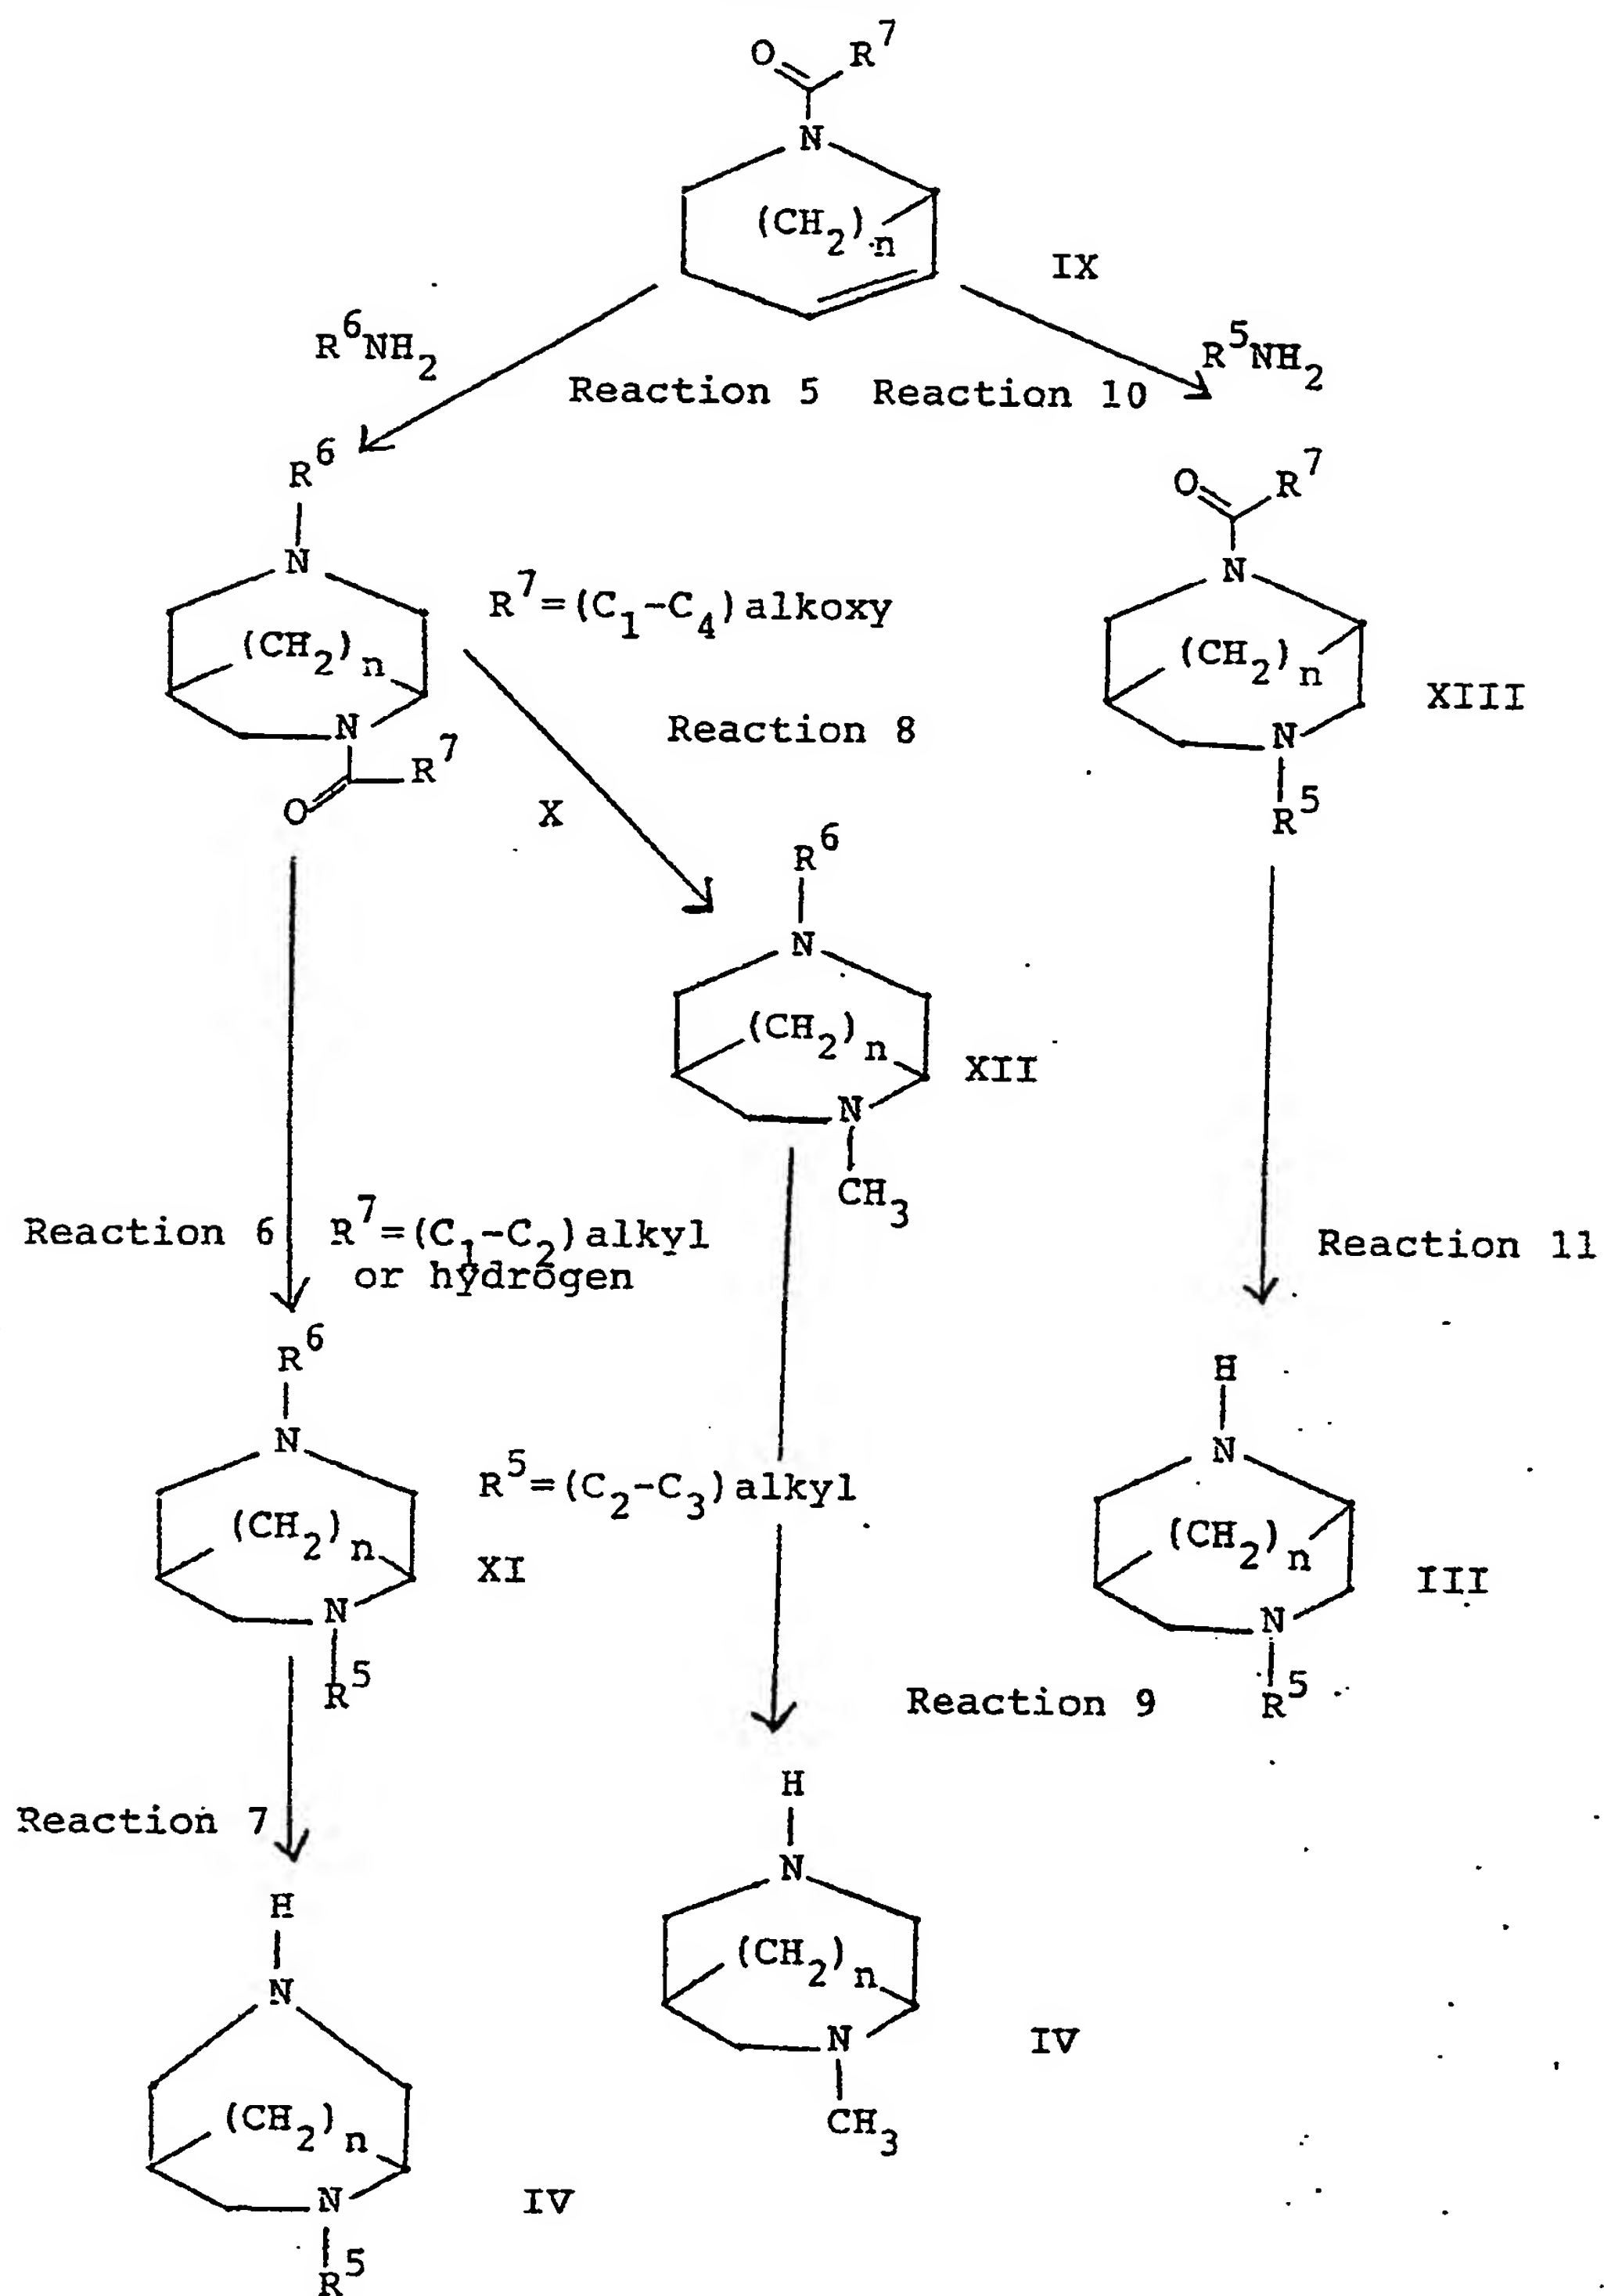

Scheme 1

Scheme 2

### Scheme 3

As shown in Schemes 1, 2 and 3, a compound of the formula III may be prepared from a compound of the formula V or a compound of the formula IX and a compound of the formula IV may be prepared from a compound of the formula VII or a compound of the formula IX.

In the foregoing schemes, n is 1 or 2; R<sup>5</sup> is as defined above; R<sup>6</sup> is hydrogen or a group easily removed under reductive (e.g., hydrogenolysis) conditions (for example, benzyl para-methoxy benzyl or para-nitro benzyl); R<sup>7</sup> is hydrogen, (C<sub>1</sub>-C<sub>4</sub>)alkyl or (C<sub>1</sub>-C<sub>4</sub>)alkoxy. Preferred R<sup>6</sup> groups are hydrogen and benzyl.

Compounds of the formula V, VII and IX may be prepared by an aza Diels-Alder reaction (see S. Weinreb et al., *Heterocycles*, 12, 949 (1979)). Preferably, compounds of the formula V and VII are prepared by the method of Grieco (S.D. Larson et al., *J. Am. Chem. Soc.* 107, 1768 (1985)). Compounds of the formula IX wherein n is 2 are preferably prepared by the method of Cava (M. P. Cava et al., *J. Org. Chem.*, 30, 3772 (1965)). Unless indicated otherwise, the pressures under which the reactions of the above scheme are carried out are not critical but ambient pressure (i.e., about 1 atmosphere) is preferred.

In Reactions 1, 3, 5 and 10, a compound of the formula V, VII, or IX is dissolved in a protic or an aprotic solvent (in the case of reactions 1 and 3, an equivalent of acid (e.g., hydrochloric acid) is also added). The solvent is preferably methanol. The solution is maintained at a temperature of about -78 to about 0°C and is exposed first to an oxidizing agent (preferably, ozone) and then to a reducing agent (preferably, dimethylsulfide). The reaction mixture is then maintained at about -10 to about -25°C and an acid salt (preferably, the hydrochloride salt) of an appropriately substituted amine is added, together with a reducing agent (preferably, sodium cyanoborohydride, to prepare a compound of the formula VI, VIII, X or XIII by reductive amination. Further reactions proceed as follows:

#### Reaction 11

A compound of the formula XIII is converted to a compound of the formula III by acid hydrolysis, for example, by dissolving the compound of the formula VI in aqueous HBr and refluxing the reaction mixture.

#### Reactions 6 and 8

A compound of the formula X is converted to a compound of the formula XI (when R<sup>7</sup> is C<sub>1</sub>-C<sub>2</sub> alkyl) or to a compound of the formula XII (when R<sup>7</sup> is (C<sub>1</sub>-C<sub>4</sub>) alkoxy) by reduction in an aprotic solvent at a temperature of about 0 to about 150°C. The solvent is preferably tetrahydrofuran and the reducing agent is preferably lithium aluminum hydride. It should be noted that in Reaction 6, the COR<sup>7</sup> group is converted to R<sup>5</sup>.

#### Reactions 2, 4, 7 and 9

A compound of the formula VI is converted to a compound of the formula III, a compound of the formula VIII is converted to a compound of the formula IV, a compound of the formula XI is converted to a compound of the formula IV, and a compound of the formula XII is converted to compound of formula IV by reduction in a protic or aprotic solvent at a temperature of about 25 to about 100°C. Preferred solvents are methanol and acetic acid. Preferably, the reduction is accomplished by hydrogenation at a pressure of about 1 to about 100 atmospheres (preferably about 1 to about 5 atmospheres) in the presence of a transition metal catalyst (preferably, Pd(OH)<sub>2</sub> or Pd on carbon in the presence of an acid (preferably, HCl). It should be noted that when R<sup>6</sup> is hydrogen, Reactions 2, 4, 7, and 9 are not necessary.

The pharmaceutically acceptable acid addition salts of the compounds of the formula I are prepared in a conventional manner by treating a solution or suspension of the free base of the formula I with about one chemical equivalent of a pharmaceutically acceptable acid. Conventional concentration and recrystallization techniques are employed in isolating the salts. Illustrative of suitable acids are acetic, lactic, succinic, maleic, tartaric, citric, gluconic, ascorbic, benzoic, methanesulfonic, cinnamic, fumaric, phosphonic, hydrochloric, hydrobromic, hydroiodic, sulfamic and sulfonic acid.

The pharmaceutically acceptable cationic salts of the compounds of the formula I may be prepared by conventional methods from the corresponding acids, e.g., by reaction with about one equimolar amount of a base. Examples of suitable cationic salts are those of alkali metals such as sodium or potassium, alkaline earth metals such as magnesium or calcium, and ammonium or organic amines such as diethanol amine or N-methylglucamine.

The compounds of formula I and the pharmaceutically acceptable acid addition salts thereof are useful in the treatment of bacterial infections of broad spectrum, particularly the treatment of infections of gram-positive bacterial strains.

The compounds of the present invention may be administered alone, but will generally be administered in admixture with a pharmaceutical carrier selected with regard to the intended route of administration and standard pharmaceutical practice. For example, they can be administered orally or in the form of tablets containing such excipients as starch or lactose, or in capsules either alone or in admixture with excipients, or in the form of elixirs or suspensions containing flavoring or coloring agents. In the case of animals, they are advantageously contained in an animal feed or drinking water in a concentration of about 5 to about 5000 ppm, preferably about 25 to about 500 ppm. They can be injected parenterally, for example, intramuscularly, intravenously or subcutaneously. For parenteral administration, they are best used in the form of a sterile

aqueous solution which can contain other solutes, for example, enough salt or glucose to make the solution isotonic. In the case of animals, compounds can be administered intramuscularly or subcutaneously at dosage levels of about 0.1 to about 50 mg/kg/day, advantageously about 0.2 to about 10 mg/kg/day given in a single daily dose or up to 3 divided doses.

The invention also provides pharmaceutical compositions comprising an antibacterially effective amount of a compound of the formula I or a pharmaceutically acceptable acid addition salt thereof together with a pharmaceutically acceptable diluent or carrier. 5

The compounds of the present invention can be administered to humans for the treatment of bacterial diseases by either the oral or parenteral routes, and may be administered orally at dosage levels of about 0.1 to about 500 mg/kg/day, advantageously about 0.5 to about 50 mg/kg/day given in a single dose or up to 3 divided doses. For intramuscular or intravenous administration, dosage levels are about 0.1 to about 200 mg/kg/day, advantageously about 0.5 to about 50 mg/kg/day. While intramuscularly administration may be a single dose or up to 3 divided doses, intravenous administration can include a continuous drip. Variations will necessarily occur depending on the weight and condition of the subject being treated and the particular route of administration chosen as will be known to those skilled in the art. 10 15

The antibacterial activity of the compounds of the invention is shown by testing according to the Steer's replicator technique which is a standard *in vitro* bacterial testing method described by E. Steers et al., *Antibiotics and Chemotherapy*, 9, 307 (1959).

The following non-limiting examples illustrate the invention. All melting points referred to in the Examples are uncorrected. 20

#### Example 1

##### 2-Carboethoxy-2-azabicyclo[2.2.2]oct-5-ene

Following the procedure of Cava (M. P. Cava et al., *J. Org. Chem.*, 30, 3772 (1965)), with the Borne modification (R. F. Borne et al., *J. Med. Chem.*, 16, 853 (1973)), 50.0 g (0.32 mol) of methylene bisurethane and 31 ml (26.1 g, 0.33 mol) of 1,3-cyclohexadiene were condensed in 415 ml of benzene in the presence of 8.7 ml (10.0 g) of BF<sub>3</sub> etherate to provide 25.0 g (43%) of the title compound as a clear liquid, bp 74-75°C/0.2 Torr. 25 30

#### Example 2

##### 3-Benzyl-6-carboethoxy-3,6-diazabicyclo[3.2.2]nonane

A stream of ozone was passed through a 1.2 L methanol solution of 40.0 g (0.22 mol) of 2-carboethoxy-2-azabicyclo[2.2.2]oct-5-ene at -78°C for 5.5 hours. At that time, the reaction mixture became blue and it was found by thin layer chromatography (TLC) on silica gel, using 1:1 EtOAc(ethyl acetate)/hexane as the eluant, that the starting olefin had been consumed. Nitrogen was bubbled through the reaction mixture to remove excess ozone and 100 ml of dimethylsulfide was then added dropwise. The reaction mixture was then allowed to warm slowly to 0°C. Following 4 hours of additional stirring at 0°C, 200 g (1.39 mol) of benzylamine hydrochloride and 200 g of activated 3Å molecular sieves were added and the reaction mixture was stirred for 4 hours at room temperature. The reaction mixture was then cooled to 0°C and treated with a 200 ml methanol solution of 69.8 g (1.11 mol) of sodium cyanoborohydride dropwise over 40 minutes. Additional stirring was continued for 5 hours at room temperature followed by filtration, as the insoluble material was washed well with methanol. The filtrate was concentrated to an oil, cooled to 0°C, and carefully acidified (HCN evolution) with 500 ml of aqueous 1N HCl with stirring. After the effervescence had ceased (4 hours), sodium hydroxide pellets were added carefully at 0°C until the mixture was basic (pH 13). The oil that had separated was removed in a separatory funnel and combined with 5 x 100 ml EtOAc extracts of the aqueous layer which were then dried (K<sub>2</sub>CO<sub>3</sub>) and evaporated. Partial distillation of the oil (60°C, 2 Torr) to remove excess benzylamine and chromatography of the residue (63 g) on 290 g of silica gel using an EtOAc-hexane eluant (1:9 to 3:7) afforded 22.2 g of the title compound (R<sub>f</sub> 0.65, EtOAc-hexane, 1:1) as an oil. The product was further purified by short-path distillation to provide 21.1 g (33%) as a pale yellow oil, bp 166-168°C/0.1 Torr; <sup>1</sup>H-NMR (CDCl<sub>3</sub>, 250 MHz) δ 1.20 and 1.24 (3H, two t, J=7), 1.4-1.6 (1H, m), 3.55 and 3.56 (3H, two s), 4.12 and 4.13 (2H, two quartets, J=7), 7.2-7.4 (5H, m); IR(CHCl<sub>3</sub>) 1673 cm<sup>-1</sup>; MS (m/e) 288 (M<sup>+</sup>), 245, 197, 134, 91. 40 45 50 55 60

After a gentle reflux period of 2 hours, the mixture was chilled to 0° C and carefully quenched by the sequential addition of 6.32 ml of water, 6.32 ml of aqueous 15% aqueous NaOH solution, and 19.0 ml of water. The resulting salts were removed by filtration and were washed well with ether. The filtrate was dried (K<sub>2</sub>CO<sub>3</sub>) and evaporated to a clear oil which was distilled to provide 15.13 g (90%) of the title compound as a clear liquid, bp 120-122° C/0.1 Torr: <sup>1</sup>H-NMR (CDCl<sub>3</sub>, 250 MHz) δ 1.5-1.7 (1H, m), 1.8-2.0 (m, 3H), 2.4 (3H, S), 3.55 (2H, centroid of AB pattern, J=15), 7.2-7.4 (5H, m); <sup>13</sup>C-NMR (CDCl<sub>3</sub>, 63 MHz) δ 22.7, 24.7, 31.8, 44.1, 57.2, 57.4, 58.1, 62.1, 62.5, 126.8, 128.2, 140.0.
